

**UNDERSTANDING
DEVICE
AS A
SERVICE
WITH ETHOS**

Could DaaS be the key to unlocking organic growth?

For businesses of all sizes, Device as a Service (DaaS) solutions can transform IT delivery, resulting in greater IT optimisation.

BUT WHAT IS DaaS?

The DaaS model offers PC's, smartphones and other mobile computing devices as a subscription based service.

DaaS eases the IT needs of a company by outsourcing the hardware software and device management.

Time Management

Reallocation of resources is a key benefit of a DaaS shift, enabling businesses to do more with its IT infrastructure.

In turn, reallocating internal resources positively affects cash flow and business assets.

Cost Control

The resulting budget efficiency can allow companies to make the most of its IT investment.

Turning what could be a significant upfront capital expense into a monthly subscription based cost.

Security

DaaS also provides improved security, maintaining data and device protection while keeping employees connected and secure, wherever they work.

IT Resource

Other benefits include reallocating IT personnel's attention to more revenue-generating activity and increasing employee productivity through access to the latest technologies.

How can DaaS support your growth plans?

Successful digital transformation requires more than just a few devices. By leveraging DaaS, businesses can more affordably secure both updated technology and supporting services.

As a result, in-house IT can benefit from the DaaS model because it reduces their burden by outsourcing hardware, software and support management tasks to DaaS providers.

**Is now the
right time?**

With businesses adopting a more permanent hybrid model and employees adapting to a blended remote and in-office work experience, businesses must adjust their IT solutions.

Meeting the demands of a modern workplace requires companies to provide the latest devices, software and services to keep employees connected, secure and productive.

A DaaS deployment allows a user's device to be equipped for their needs, with all their data stored in the cloud and all apps customised and ready to go right out of the box without involving the company's IT admin.

What's Next?

While adopting DaaS can impact servicing employees in remote and office requirements, a DaaS deployment should be more than just a one size fits all solution.

Depending on a company size, we can create a bespoke plan that can be tailored to meet your business's IT requirements, goals and budget needs/
